

Crypto 101: The Ultimate Beginner's Trading Course with CoachEmmy

Your Journey to Crypto Trading Mastery

Welcome to the ultimate crypto trading course for beginners! Our goal is to provide a comprehensive, **free resource** that rivals paid courses.

We'll start with the basics, assuming you know nothing about trading, and guide you to an intermediate (or even advanced) level. We'll simplify complex concepts and share exclusive insights from a seasoned trader with over a decade of experience, trading crypto since its earliest days.

Course Roadmap: From Basics to Advanced Strategies

01

Crypto Basics (Today!)

Understanding the foundational elements of cryptocurrency and trading.

02

Charting Essentials

Mastering chart analysis to identify trends and patterns.

03

Effective Indicators

Separating useful indicators from the noise and understanding their application.

04

Building Trading Systems

Designing and implementing profitable trading systems.

05

Top Trading Strategies

Discovering our favorite, proven cryptocurrency trading strategies.

06

Trading Psychology

Overcoming mental blocks and developing a winning trader's mindset.

Each step builds on the last, so don't skip ahead! The foundations are crucial for long-term success.

Today's Focus: Crypto Basics

In this first meet, we're diving deep into the crypto basics, bringing you up to speed even if you're a complete beginner.

- **Choosing the Right Broker:** Why this is a critical first step for profitable trading.
- **TradingView Fundamentals:** Navigating our primary charting tool.
- **X and Y-Axis Demystified:** Understanding price and time on charts.
- **Timeframe Analysis:** How different timeframes impact your perspective.
- **Candlesticks Explained:** Decoding the constant battle between buyers and sellers.
- **Crypto Trading Pairs:** Understanding how assets are traded against each other.
- **Order Types:** Mastering the various ways to execute trades.
- **Best Assets to Trade:** Identifying highly liquid and volatile cryptocurrencies.

Choosing the Right Broker: Your Foundation for Success

Selecting the right broker is paramount. Many platforms can be scams or burden you with outrageous fees, eating into your profits. Here's what to look for:

1

Low Fees

Minimize trading costs to maximize returns.

2

Diverse Assets

Access a wide range of tradable cryptocurrencies.

3

Established Reputation

Choose brokers with a large, satisfied customer base, not new, unproven exchanges.

4

Excellent Customer Service

Ideally, look for live chat support for immediate assistance.

5

User-Friendly Interface

An intuitive platform makes trading smoother, especially for beginners.

We recommend **Bybit** for its low fees, extensive client base, live chat support, and easy interface. They even allow direct crypto purchases with credit/debit cards. Alternatively, Binance is another popular option. Most interfaces are similar, so this course will remain relevant regardless of your choice.

Once you have a brokerage, fund your account by sending crypto directly or using a credit/debit card. Next, set up your **TradingView** account – our essential charting tool!

[Sign Up for Bybit](#)

[Get TradingView](#)

Navigating TradingView: Your Charting Companion

TradingView (tradingview.com) is your go-to charting tool. Sign up for a free account to access its powerful web version or download the desktop/mobile app. We'll be using it extensively throughout this course.

Understanding the X and Y-Axis

On any chart, you'll notice:

- **Y-Axis (Vertical):** Represents **Price**.
- **X-Axis (Horizontal):** Represents **Time**.

These axes show you the price movement of an asset over a specific period. You can adjust the timeframe, which changes the time displayed on the X-axis.

Decoding Candlesticks: The Battle of Buyers and Sellers

Each "candle" on the chart represents price action within a specific timeframe (e.g., one day, four hours).

- **Low:** The lowest price reached during the period.
- **High:** The highest price reached during the period.
- **Open:** The price at the start of the period.
- **Close:** The price at the end of the period.

Bullish (Green) Candles:

If the closing price is higher than the opening price, it indicates more buyers than sellers. Price moved upwards.

Bearish (Red) Candles:

If the closing price is lower than the opening price, it indicates more sellers than buyers. Price moved downwards.

Key Candlestick Patterns:

- **Bullish Engulfing:** A large green candle completely covering the previous red candle, often signaling upward movement.
- **Bearish Engulfing:** A large red candle completely covering the previous green candle, often signaling downward movement.
- **Pin Bars:** Small body, long wick. A long lower wick suggests buyers rejected lower prices (bullish signal). A long upper wick suggests sellers rejected higher prices (bearish signal).

Candlesticks reveal the **psychology of the market** – the constant war between buyers and sellers.

Cryptocurrency Pairs and Order Types

Understanding Trading Pairs

Cryptocurrencies are always traded in **pairs**, like BTC/USD or ETH/BTC.

- **Base Currency (First):** The asset you are buying or selling.
- **Quote Currency (Second):** The asset used to price the base currency.

For example, in **BTC/USD**, you're trading Bitcoin against the US Dollar. If you buy **ETH/BTC**, you believe Ethereum will outperform Bitcoin.

Mastering Order Types

When placing a trade, you have several order types to choose from:

- **Market Order:** Instantaneously buy or sell at the current best market price.
- **Take Profit (TP):** Automatically close a trade for profit when price reaches a specified level.
- **Stop Loss (SL):** Automatically close a trade to limit losses if price moves against your position.
- **Trailing Stop Loss:** A dynamic stop loss that adjusts as price moves in your favor, locking in profits and limiting downside.
- **Stop Orders (Buy/Sell Stop):** Enter a trade automatically when price reaches a specified level, usually to catch momentum.
- **Limit Order (Buy/Sell Limit):** Place an order to buy at a lower price or sell at a higher price than the current market, waiting for a better entry point.

Which Assets are Best to Trade?

High Volume & Market Cap

Focus on cryptocurrencies with high trading volume and large market capitalization to ensure liquidity. This means there are enough buyers and sellers for you to easily enter and exit trades without significant price impact.

Avoid Low Liquidity

Trading illiquid assets can lead to "slippage" and difficulty selling when you want to, potentially leaving you stuck in a position longer than intended. Low liquidity makes it harder to find a counterparty for your trades.

Focus on Top Tier

For day trading, it's safest to stick to cryptocurrencies within the top 10 or 25 by market cap. We primarily recommend **Bitcoin (BTC)** and **Ethereum (ETH)** due to their high volatility and excellent liquidity.

We've covered a lot of ground today! In premium class, we'll dive into **Charting**, including support and resistance, trend lines, and secret chart patterns that can help you accurately predict market movements. Don't miss it!
